

The Horns Public House Crazies Hill RG10 8LY

The Horns Lighting Strategy

Overview

HHL will install an outside lighting system that will be low level and downward facing. All lighting will be capped such that upward spill of lighting will be minimised and corridors provided for transit across the property where light is minimised.

Specifics:

- All high level flood lighting to be removed from rear and north side elevations.
- Existing front low-level lighting on elevation to be replaced with downward facing lighting
- Existing lighting on side elevation and entrance porch to be downward facing and beneath porch area to restrict upward spill of light.
- Existing Rear elevation lighting to be low level and downward facing, capped to minimise upward spill of light.
- Existing gazebo with clear roof and lighting, to be replaced with a slate roof gazebo to remove any upward spill of light.
- Existing lampposts placed down the centre of the property to be upgraded to downward facing and capped to prevent upward spill of light.
- With the removal of the decking area and associated lighting and together with the car park remaining floodlight free, this provides a corridor along each side of the property to the rear woodland area.
