COMMENTS:
I would like to object to this planning application on the grounds
of health and safety and enviromental impact. The main hazards of
storing kerosene include flammability, which can lead to fires or
explosions, especially from vapors traveling to ignition sources,
and health risks, such as skin irritation from contact and
potential respiratory issues from inhalation. Improper storage in
unapproved containers or near heat sources increases these risks, as
does inadequate ventilation, which can allow flammable vapors to
accumulate.

Fire and explosion hazards
Flammable vapors: Kerosene vapors are heavier than air and can
travel long distances to an ignition source, causing a flash fire or
explosion.
Accumulation: Vapors can build up in confined spaces, increasing the
risk of ignition.
Contained pressure: Containers exposed to heat can burst due to
increased pressure.
Spills: Spilled kerosene can create an explosive atmosphere and can
reignite even if the liquid has evaporated.
Health hazards
Skin contact: Prolonged or frequent exposure can cause dermatitis
(eczema) and irritation.
Inhalation: Breathing in vapors can cause respiratory irritation and
other health effects.
Ingestion: Ingesting kerosene is dangerous and requires immediate
medical attention.
Eye contact: It can cause pain, stinging, and burning. This is
without the added diesel.
There is also the impact on any inevitable evacuation to the nearby
care residency should there be any incident along with the residents
living in the close vicinity. Chemical spillages may also soak into
the ground therefore if soaked deep enough go into the water table
and effect waterways with the potential of endangering the lives of
wildlife and vegetation in the country parks and along the rivers.
The edge of a country park in a small village area I plead should
not be even considered as a viable option.
