

Biodiversity Net Gain Assessment

Survey site:

71 London Road, Wokingham, RG40 1YA

Client:

Wokingham Borough Council

Report date:

11th February 2025

Project:

This report is prepared to inform a planning application with the Wokingham Borough Council. The proposal is described as:

Front and rear extensions with associated internal alterations

Limitations and Copyright

Arbtech Consulting Limited has prepared this report for the sole use of the above-named client or their agents in accordance with our General Terms and Conditions, under which our services are performed. It is expressly stated that no other warranty, expressed or implied, is made as to the professional advice included in this report or any other services provided by us. This report may not be relied upon by any other party without the prior and express written agreement of Arbtech Consulting Limited. The conclusions and recommendations contained in this report are based upon information provided by third parties. Information obtained from third parties has not been independently verified by Arbtech Consulting Limited.

Industry Guidelines and Standards

This report has been written with due consideration to:

- British Standard 42020 (2013). Biodiversity – Code of Practice for Planning and Development.
- British Standard 8683:2021 (2021). Process for Designing and Implementing Biodiversity Net Gain.
- Chartered Institute of Ecology and Environmental Management (2017). Guidelines for Preliminary Ecological Appraisal. 2nd edition. Chartered Institute of Ecology and Environmental Management, Winchester.
- Chartered Institute of Ecology and Environmental Management (2017). Guidelines on Ecological Report Writing. Chartered Institute of Ecology and Environmental Management, Winchester.
- Chartered Institute of Ecology and Environmental Management (2018). Guidelines for Ecological Impact Assessment in the UK and Ireland: Terrestrial, Freshwater, Coastal and Marine. Version 1.1. Chartered Institute of Ecology and Environmental Management, Winchester.
- Chartered Institute of Ecology and Environmental Management (2020). Guidelines for Accessing, Using and Sharing Biodiversity Data in the UK. 2nd Edition. Chartered Institute of Ecology and Environmental Management, Winchester.
- Chartered Institute of Ecology and Environmental Management, Construction Industry Research and Information Association & Institute of Environmental Management and Assessment (2019). Biodiversity Net Gain – Good Practice Principles for Development.

Proportionality

The work involved in preparing and implementing all ecological surveys, impact assessments and measures for avoidance, mitigation, compensation and enhancement should be proportionate to the predicted degree of risk to biodiversity and to the nature and scale of the proposed development. Consequently, the decision-maker should only request supporting information and conservation measures that are relevant, necessary and material to the application in question. Similarly, the decision-maker and their consultees should ensure that any comments and advice made over an application are also proportionate.

The desk studies and field surveys undertaken to provide a Preliminary Ecological Appraisal (PEA) might in some cases be all that is necessary.

(BS 42020, 2013)

Executive Summary

Arbtech Consulting Limited was instructed by Wokingham Borough Council to undertake a Biodiversity Net Gain (BNG) Assessment at 71 London Road, Wokingham RG40 1YA (hereafter referred to as “the site”). The assessment was required to inform a planning application for front and rear extensions with associated internal alterations (hereafter referred to as “the proposed development”).

The baseline habitat value of the site is 1.67 area-based habitat units and 0.02 hedgerow units with the proposed development resulting in a 11.36% area-based net loss and a 21.93% net gain for hedgerows. The proposed development is therefore not anticipated to meet the minimum target of 10% biodiversity net gain and thus is non-compliant with legislation (Environment Act 2021). The proposed development does not satisfies the trading rules.

BNG change summary

	Area units	Linear Units	Watercourse
% Change	-11.36%	+21.93%	N/A
Units required for a 10% net gain	0.36 habitat units including 0.18 units of medium distinctiveness (Individual trees), 0.01 units of low distinctiveness and 0.17 units of any distinctiveness.	N/A	N/A

It is not possible to achieve the required net gain on site or satisfy the trading rules within the site boundaries, therefore, off-site credits will need to be purchased in order to off-set the loss on site.

1.0 Introduction and Context

1.1 Background

Arbtech Consulting Limited was instructed by Wokingham Borough Council to undertake a Biodiversity Net Gain (BNG) Assessment at 71 London Road, Wokingham RG40 1YA (hereafter referred to as “the site”). The assessment was required to inform a planning application for front and rear extensions with associated internal alterations (hereafter referred to as “the proposed development”). A plan showing the proposed development is provided in Appendix 1.

This report should be read in conjunction with the following documents:

- Defra Statutory Biodiversity Metric for 71 London Road, RG40 1YA (Arbtech, 2024)
- PEA/PRA Survey Report for 71 London Road, RG40 1YA (Arbtech, 2024)

1.2 Site Location, Geology and Landscape Context

The site is located at National Grid Reference and has an area of approximately 0.09ha comprising of urban habitat, individual trees and hedgerow. The site is set within an urban area, with the surrounding area consisting predominantly of residential dwellings and their associated gardens. Beyond the immediately adjacent houses and gardens, there are a small number of recreational fields with scattered trees and some small parcels of woodland. The local area is connected via fragmented hedgerows and treelines, connecting the site to more substantial habitat nearby. A site location plan is provided in Appendix 2.

1.3 BNG Informative

BNG is a specific, measurable outcome of project activities that deliver demonstrable and quantifiable benefits to biodiversity compared to the baseline situation. In order to achieve BNG, a project must be able to demonstrate that it has followed all 10 of the Principles of Biodiversity Net Gain (as outlined in the British Standard 8683:2021 Process for Designing and Implementing Biodiversity Net Gain).

The legalised Environment Act (2021) requires developments in England to demonstrate a measurable net gain in biodiversity and sets a target of a minimum of 10% BNG for all developments. It also stipulates that a management plan with a minimum 30-year term, should be adopted to ensure biodiversity net gain can be delivered. The Environment Act (2021) states biodiversity net gain is mandatory for sites over 0.5ha as of February 2024. The requirement for biodiversity net gain is also enshrined within the National Planning Policy Framework (NPPF, 2021). The DEFRA Statutory Biodiversity Metric is the widely accepted tool used to calculate BNG. It enables the calculation of habitat value pre- and post-development in order to determine the overall change in biodiversity value as a result of the proposed development. The Biodiversity Metric has separate BNG assessments for areas of habitat, hedgerows and watercourses. The biodiversity value of a site should be maximised. However, it may not always be possible to achieve a 10% biodiversity net gain within a site and therefore the Statutory Biodiversity Metric can also account for offsite habitat creation, where land is available. Alternatively, developers can seek to provide an agreed financial contribution to an appropriate third party (such as the Local Authority, the UK Government or another landowner) to deliver the required biodiversity net gain elsewhere on their behalf.

2.0 Methodology

2.1 *Baseline Biodiversity Value*

The baseline BNG Calculation was informed by Preliminary Ecological Appraisal and Roost Assessment (PEA/PRA) (Arbtech, 2024). A baseline habitat plan is provided in Appendix 3.

Habitat Classification

The PEA/PRA classified the habitats on site according to The UK Habitat Classification Habitat Definitions Version 2.0 (The UK Habitat Classification Working Group, July 2023).

Habitat Area/Length

The area or length of each habitat was calculated using qGIS software. In calculating the area or length of each habitat, habitats which occur as two or more isolated parcels across the site were combined, where they were deemed to be of a similar composition and condition. Distinctions were made between habitats to be retained (i.e. left as found in baseline), enhanced (i.e. improved condition) or lost (i.e. destroyed by proposed development).

Areas of scattered trees were calculated using the Tree Helper tool within the Statutory Biodiversity Metric. Class sizes for urban trees are set out in Table 8-1 of the Statutory Biodiversity Metric User Guide (Natural England, 2023).

Habitat Condition

Habitat condition was assessed using the relevant condition assessment sheets found in the Statutory Biodiversity Metric User Guide (Natural England, 2023).

Strategic Significance

Strategic significance was assigned for each habitat based upon a review of the following:

- Ecological value
- Function within the landscape
- Any site or habitat allocations under the Wokingham Borough Local Development Framework Adopted Core Strategy Development Plan (Adopted 2010)

2.2 *Post Development Biodiversity Value*

The post development BNG Calculation was informed by the Proposed Site Plan (Christopher James Architecture, 2024) which is included in Appendix 1. A post development habitat plan is provided in Appendix 4.

Habitat Classification

Proposed habitats were translated to their equivalents in the UK Habitat Classification using The UK Habitat Classification Habitat Definitions Version 2.0 (The UK Habitat Classification Working Group, July 2023) and the information provided within the Proposed Site Plan (Christopher James Architecture, 2024).

Habitat Area/Length

The area or length of each proposed habitat was calculated using qGIS software. In calculating the area or length of each habitat, habitats which occur as two or more isolated parcels across the site were combined, where they were deemed to be of similar composition and condition. Distinctions were made between habitats to be retained (i.e. left as found in baseline), enhanced (i.e. improved condition) or newly created.

Areas of scattered trees were calculated using the Tree Helper tool within the Statutory Biodiversity Metric. Class sizes for urban trees are set out in Table 8-1 of the Statutory Biodiversity Metric User Guide (Natural England, 2023).

Habitat Condition

Target habitat condition for each proposed habitat was determined assessed using the Temporal Multipliers Tool and the Enhancement Temporal Multipliers Tool included in the Statutory Biodiversity Metric spreadsheet as well as the relevant condition assessment sheets found in the Statutory Biodiversity Metric User Guide (Natural England, 2023). This is based on the assumption that a 30-year management plan will be adopted for the site.

Strategic Significance

Strategic significance was assigned for each proposed habitat based upon a review of the following:

- Likely ecological value
- Function within the landscape
- Any site or habitat allocations under the Wokingham Borough Local Development Framework Adopted Core Strategy Development Plan (Adopted 2010)

2.3 Limitations

No specific limitations for this assessment.

3.0 Results

3.1 Baseline Habitats

Table 1 details the baseline habitats present within the site along with their area/length, condition and strategic significance. A full condition assessment for each habitat (where relevant) is provided in Appendix 5a.

Table 1: Baseline Biodiversity Value

Habitat	Area (ha) / Length (km)	Description	Condition Assessment	Strategic Significance
Artificial unvegetated, unsealed surface [u1c]	0.019	All the artificial unvegetated unsealed surface on site is shingle or gravel. The majority of this is a driveway which takes up the majority of the north of site, surrounding the south and west of B1 with another small area to the northeast. There are also two shingle pathways, one in the central north of site from the site boundary to the house and the other along the west of B1 between two areas of hardstanding.	N/A	Low - Area/compensation not in local strategy
Developed land; sealed surface – Hard standing [u1b]	0.005	There are five areas of hardstanding on site; one small path to the north of B1 which connects via shingle to a second area of hard standing to the southwest of B1. An area of paving slabs to the west of B2 and southeast of B1, separated by a small area of shingle. A path and small area of paving slabs to the west of site, with a temporary greenhouse on the slabs. One patio area to the southeast of site with table and chairs.	N/A	Low - Area/compensation not in local strategy
Developed land; sealed surface – Buildings [u1b5]	0.011	There are three permanent and one temporary buildings on site, designated B1 – B4. B1 is a two story residential dwelling with hipped roof to the north of site. There is an extension to the south of B1 with a gabled roof, and a garage attached to the east of B1 with a pitched roof. B2 is a cabin to the southeast of B1 with a gabled roof, predominantly used for storage. B3 is a small shed to the south of site with a gabled roof which is used as storage. B4 is a temporary polytunnel to the west of site on paving slabs.	N/A	Low - Area/compensation not in local strategy
Ground level planters [u1 845]	0.007	There are 9 flower beds scattered across site, including one to the north, four to the southeast, one to the southwest and three along the eastern and western site	N/A	Low - Area/compensation not in local strategy

		boundary. Species vary from flowerbed to flowerbed, however species present include lavender (A), rosemary (F), ivy (F), cranes bill (F), fern (F), barberry (O), roses (O), hydrangea (O), spotted laurel (O), bramble (O), foxglove (R) and cedar (R).		
Vegetated garden [u1 828]	0.046	There are two main areas of vegetated garden on site. The first is a small area of grass to the north of B1, separated by two paths. The grass here is well managed, with sword length of ~5cm throughout. Species present include perennial rye grass (D), self heal (F), heath star moss (F), speedwell (F) and dandelion (O). The second area of vegetated garden takes up the majority of the south of site. As with the northern garden, the grass here is well managed, with sword length of ~5cm. Species present include perennial rye grass (D), annual meadow-grass (F), dandelion (O), heath star moss (O), speedwell (O) and ox eye daisies (R).	N/A	Low - Area/compensation not in local strategy
Urban tree [u1 32]	0.1954	There are 12 scattered trees throughout the southern garden. The trees present are as follows: 1x apple – medium - >10m – moderate condition 5x holly – medium - >10m – moderate condition 1x cherry – medium - >8m – moderate condition 1x hawthorn – medium - >8m – moderate condition 1x hazel – medium - >8m – moderate condition 1x sycamore – medium - >12m – moderate condition 2x unknown – medium - >10m – moderate condition	Moderate	Low - Area/compensation not in local strategy
Non-native and ornamental hedgerow [h2b]	0.022	There are three sections of hedgerow on site, all three of which are around the northern site boundaries. All three sections of hedgerow consist predominantly of garden privet (D) with small sections of ivy (O) and bramble (O) throughout.	Poor	Low - Area/compensation not in local strategy

3.2 Post Development Habitats

Table 2 details the post development habitats present within the site along with their area/length, condition and strategic significance. An assessment of the anticipated condition for each habitat (where relevant) is provided in Appendix 5b, which is based on the assumption that a 30 year management plan will be implemented for the site. The proposed development will result in the loss of vegetated garden, ground level planters, hard standing and artificial surface.

Table 2: Post Development Biodiversity Value

Habitat	Area / Length	Description	Target Condition	Strategic Significance
Artificial unvegetated, unsealed surface [u1c]	Created: 0.007 Retained: 0.016	The majority of the existing shingle will be retained, however some small areas to the south and west of the existing building will be removed in order to accommodate the extension. In addition, a new area of gravel will be added to the north of the southern garden to accommodate a new car park, and a small area to the west of the existing building will be added when the existing flower bed is removed.	N/A	Low - Area/compensation not in local strategy
Developed land; sealed surface – Hard standing [u1b]	Created: 0.001 Retained: 0.002	Three areas of hard standing on site will be removed: the patio to the southeast of site will be replaced with vegetated garden, and the hardstanding either side of the existing southern extension will be removed and replaced with an extension. A new hard standing patio will be added to the southeast of the existing building, in addition to an area of paving slabs to the northwest of site to accommodate bin storage.	N/A	Low - Area/compensation not in local strategy
Developed land; sealed surface – Buildings [u1b5]	Created: 0.008 Retained: 0.007	The majority of B1 will be retained, with the southern extension and eastern garage being demolished and replaced. In addition, an extension will be added to the south and west of the building. All other buildings on site will be retained.	N/A	Low - Area/compensation not in local strategy
Ground level planters [u1 845]	Retained: 0.006	Four ground level planters on site will be removed – one to the west of the building and three to the southeast of the building. The remaining planters will be retained.	N/A	Low - Area/compensation not in local strategy
Vegetated garden [u1 828]	Created: 0.001 Retained: 0.04	Two areas of vegetated garden on site will be removed – A small portion of the vegetated garden to the north of site to accommodate hard standing for bin storage and the northern most portion of the southern garden to accommodate additional parking to the rear of the house. In addition, hard standing to the southeast of site will be removed and replaced with vegetated garden, as well as the three flower planters to the central south of site.	N/A	Low - Area/compensation not in local strategy
Urban tree [u1 32]	Retained: 0.1791	11 of the 12 medium trees on site will be retained, with the apple tree to the east of the new parking area to be removed.	Moderate	Low - Area/compensation not in local strategy
Non-native and ornamental hedgerow [h2b]	Created: 0.005 Retained: 0.0213	All hedgerow on site will be retained in addition to a small line of hedgerow being added to the site boundary to the southeast of B1.	Poor	Low - Area/compensation not in local strategy

Introduced Shrubs [u1 847]	Created: 0.0004	A small area of introduced shrubs will be added to the north of the existing building.	N/A	Low - Area/compensation not in local strategy
----------------------------	-----------------	--	-----	---

3.3 Change in Biodiversity Value of the Site

Full details are provided in the Defra Statutory Biodiversity Metric. The headline results are presented in Appendix 6.

Areas of Habitat

The baseline habitat value of the site is 1.67 units, comprising 1.56 units of scattered trees, 0.09 units of vegetated garden, 0.01 units of ground level planters and buildings, hard standing and artificial surface of no value.

The post development habitat value of the site is 1.48 units, comprising 1.38 units of retained scattered trees, 0.08 units of retained vegetated garden, less than 0.01 units of created vegetated garden, 0.01 units of retained ground level planters, less than 0.01 units of created introduced shrub, and retained and created buildings, hard standing and artificial surface of no value.

This results in a net change in biodiversity of -11.36%.

Hedgerows

The baseline hedgerow value of the site is 0.02 units, comprising entirely of non-native ornamental hedgerow.

The post development habitat value of the site is 0.03 units, comprising of 0.02 units of retained non-native ornamental hedgerow and 0.01 units of created ornamental hedgerow.

This results in a net change in biodiversity of +21.93%

4.0 Recommendations to Deliver BNG

4.1 Discussion

The current proposed plan results in a -11.36% net loss in habitat units, and a 21.93% net gain in hedgerow units. This is less than the 10% target of biodiversity net gain, and does not satisfy the trading rules.

4.2 Landscaping

It is not possible to achieve the required net gain on site or satisfy the trading rules within the site boundaries, therefore, off-site credits will need to be purchased in order to off-set the loss on site.

4.3 Biodiversity Offsetting

If the landscaping plans are not altered, the deficit will need to be delivered in a suitable offsite location i.e. biodiversity offsetting. According to the Defra Statutory Biodiversity Metric there is a unit deficit of **0.36** habitat units including **0.18** units of medium distinctiveness (Individual trees), **0.01** units of low distinctiveness and **0.17** units of any distinctiveness, and this will need to be provided to offset the loss in biodiversity and achieve a 10% biodiversity net gain.

The mechanism for securing this off-setting will need to be proposed to, and confirmed by the LPA e.g., purchasing conservation credits through a registered provider, habitat creation directly through the client owned or LPA offered land or a financial contribution towards another provider such as a local nature reserve or park. As well as the creation of new habitats, this should also secure the management of the proposed habitats to help achieve the desired condition for at least 30 years. This would be linked to the application through a planning obligation Section 106 (S106) agreement. The proposed habitat compensation should be of an appropriate distinctiveness to satisfy the trading rules of BNG. An ecology survey of the baseline habitat of any off-site land will be required to inform the baseline conditions of any land subject to off-site compensation measures.

4.4 Post Development

A Biodiversity Net Gain (BNG) Management Plan must be produced for the site. This should include recommendations for the implementation, management and monitoring of the site for at least 30 years.

Appendix 1: Proposed Development Plan

Appendix 2: Site Location Plan

Appendix 3: Baseline Habitat Plan

Appendix 4: Post Development Habitat Plan

Appendix 5a: Habitat Condition Assessment Sheets - Baseline

Condition Sheet: INDIVIDUAL TREES Habitat Type			
Habitat Types			
Individual trees – Urban trees Individual trees – Rural trees Complete a condition sheet for each tree or block of trees.			
<i>Please see the separate Line of trees condition sheet for a line of rural trees. You should only use the Line of trees condition assessment and record that habitat type in rural locations.</i>			
Habitat Description			
Block of scattered Holly, Cherry, Hawthorn, Hazel, Apple and Sycamore trees in addition to two trees whose species could not be identified due to seasonal limitations. To compensate for the limitation, these are assumed to be native trees so that the condition assessment is reflective of the best possible condition of these trees.			
Individual trees (description applied to the urban or rural environment): Young trees over 7.5 cm in diameter at breast height whose canopies are not touching.			
Urban Perimeter / Linear Blocks and Groups (description applied to the urban environment only): Groups or stands of trees (size requirement as defined above) within and around the perimeter of urban land. This includes those along urban streets, highways, railways and canals, and also former field boundary trees incorporated into developments. Canopies should predominantly overlap continuously. Groups of urban trees that don't match the descriptions for woodland may be assessed within this category.			
On-site or off-site, site name and location	On site at 71 London Road	Survey date and Surveyor name	26th November 2024 - Ashleigh Domblides
Limitations (if applicable)	N/A	Survey reference (if relating to a wider survey)	Preliminary Ecological Appraisal and Roost Assessment
Grid reference	SU 81677 68783	Habitat parcel reference	
Condition Assessment Criteria		Criterion passed (Yes or No)	Notes (such as justification)
A	The tree is a native species (or at least 70% within the block are native species).	Yes	More than 70% of trees within this block are native, including the two trees whose species were not identified.
B	The tree canopy is predominantly continuous, with gaps in canopy cover making up <10% of total area and no individual gap being >5 m wide (individual trees automatically pass this criterion).	Yes	While the majority of leaves were absent during the survey due to seasonal limitations, based on the branches it is assumed the canopy is predominantly continuous.
C	The tree is mature (or more than 50% within the block are mature) ¹ .	No	Less than 50% of trees present are mature.
D	There is little or no evidence of an adverse impact on tree health by human activities (such as vandalism, herbicide or detrimental agricultural activity). And there is no current regular pruning regime, so the trees retain >75% of expected canopy for their age range and height.	Yes	No obvious evidence of impacts on tree health.
E	Natural ecological niches for vertebrates and invertebrates are present, such as presence of deadwood, cavities, ivy or loose bark.	No	No ecological niches are present.
F	More than 20% of the tree canopy area is overhanging vegetation beneath.	Yes	The area beneath the majority of the canopy is vegetated garden.
Number of criteria passed		4	
Condition Assessment Result (out of 6 criteria)		Condition Assessment Score	Score Achieved x/√
Passes 5 or 6 criteria		Good (3)	
Passes 3 or 4 criteria		Moderate (2)	Yes (4/6)
Passes 2 or fewer criteria		Poor (1)	
Note that 'Fairly Good and Fairly Poor' condition categories are not available for this broad habitat type.			
Suggested enhancement interventions to improve condition score ²
