

WEATHER PROOFING

Weather protection for vent tile installation

The en-suite and pub WC roof vent tiles will only be installed on a dry day. The vent tiles will be installed sequentially, so that only one area of roof is exposed at any one time.

The operation to install the tile, will involve this area of the roof being open for approximately 15-30 minutes at the most.

If there is any indication that it might begin to rain, no further installations will be carried out until the weather is dry again.

Weather protection for the installation of the rear access door leading to the first floor

The process to create the opening and install the door frame may take 2-3 days

Whilst the opening is exposed to the elements, and work has ceased for the day, the opening will be boarded up and covered with a polythene sheet in order to make the opening weather tight.

Weather protection for the installation of the main entrance porch

While the existing roof is exposed for works to be carried out to join the new porch into the existing roof, the area where the existing roof is exposed will be covered by a tarpaulin sheeting. Sheeting will also cover the new porch framework as it is created until it has been tiled.
