

TPO-0782-1996 - Pine (Shown as Tree 1 on Sketch Plan) - Reduce lateral protruding branch within upper crown on eastern side by approximately 4 metres to a suitable strong growth point. Works are to be carried out in order to realign branch within the remaining crown

TPO-0782-1996 - Pine (Shown as Tree 2 on Sketch Plan) - Reduce lateral spread on Eastern, Southern and Western sides by up to 3 metres, whilst cutting back to suitably strong growth points. Remaining crown spread on Eastern, Southern and Western sides will be approximately 5-6 metres. Top is to be reduced only as required to shape and balance crown. Works are being proposed due to the asymmetrical nature of the crown and due to the removal of trees to the rear of the property now leaving the tree more exposed to high winds and adverse weather

Photograph shows protruding branch on Tree 1, proposed area branch is to be pruned back to and proximity to property

Photograph shows asymmetrical crown and extended branches on Southern, eastern and western sides.

Sketch Plan to Show the Tree locations
