SUMMARY DESCRIPTION OF WORK

WALLS
Existing brick and flint plinth walls are unstable and are to be re-built in loadbearing blockwork on new foundations to provide a sound support for the timber framed barn superstructure. The walls will be faced in re-claimed brick and flint and pointed with a lime mortar to give a similar appearance to existing.

The stained timber boarding will be removed from the barn superstructure. The frame will be repaired and strengthened by a specialist. The internal board finish and insulation will be applied to the outside of the frame members before re-cladding with new and re-claimed feather edge boarding to match existing. The exposed frame members will be left with a natural appearance finish.

WINDOWS
All windows and external doors are to be stained in softwood to suit new and existing openings in the timber structure. New small window openings to be formed between existing vertical frame members. Window positions shown on the elevations have been chosen to suit the frame member positions.

The two large glazed openings comprise the existing wagon door opening on the north elevation and the projecting gable on the south elevation, which is to become the main entrance. These will be divided with substantial timber frame members to retain the character & scale of the building. The glazing in the wagon door opening will incorporate fire escape doors. The existing boarded timber doors will be retained in a fixed open position.

ROOF
The existing clay peg tiles will be removed to allow access to the structure for repair by a specialist. Treatment of the roof will be similar to the timber frame walls. Internal board finish and external insulation will be applied before re-cladding with existing and re-claimed clay peg tiles.

GROUND FLOOR
The floor level of the main part of the barn is to be reduced by a varying amount up to 600mm to provide sufficient height beneath the main truss members for the introduction of a mezzanine floor.

MEZZANINE
Two areas of mezzanine floor will be added, one at each end of the main part of the barn. These have been designed so that a large area of the barn is retained full height and standing in the centre the full volume of the building can be appreciated.

The structure of the mezzanines and the staircases serving them will be steel and timber to give a lightweight, modern feel in contrast to the old structure around it. The mezzanines will not rely on the existing barn structure for support, being independantly supported on new steel posts on new foundations. This independence of structure will permit removal of these additions if required in the future returning the building to its existing state.

SERVICES
These will be concealed in the new ground and mezzanine floors as far as possible. It will be necessary to introduce heating units and the design and location of these can be agreed.

NOTES

All dimensions to be checked on site prior to the commencement of construction and any discrepancy should be reported as soon as possible.
