No part of it may be reproduced, edited or transmitted, in any form or by any means, electronic, mechanical, photocopying, recording or otherwise, or stored in any retrieval system of any nature, without our written permission. Its content and format are for the exclusive use of Mr J Pietrzak and his agents in dealing with this site. It may not be sold, lent, hired out or divulged to any third party not directly involved in this site without the written consent of Urban Tree Experts. It may be reproduced as part of a planning application.

This report is valid for 12 months from the site inspection. The lifespan of this report may be subject to change if the site conditions change due to unspecified works that affect the site.

Executive Summary

Urban Tree Experts was commissioned by Mr J Pietrzak to conduct a preliminary ecological appraisal (daytime bat walkover [DBW]), of 10 South Close, Wokingham, RG40 2DJ. This is to support a forthcoming planning application to Wokingham Borough Council.

The site visit was carried out on Tuesday 15 April 2025 at 2.15pm, during daylight hours. An internal and external inspection of the property and attached garage took place to look for signs of bats.

The preliminary ecological appraisal consists of a desk top study prior to the survey to review existing information about the site and its surroundings and to inform the design of subsequent bat surveys, if required. The desk top study was conducted based upon a minimum 2km search radius and it revealed one statutory designated site is located within, and one current European Protected Species Licence (EPSL) for bats has been granted within 2km of the proposed development site. The immediate surrounding habitat does not provide suitable habitat for roosting, commuting or foraging bats, due to the urban environment however, via back gardens, there is some ecological connectivity to the wider landscape which includes agricultural land/improved grassland, small copses and Emm Brook.

The DBW comprised a detailed search of the interior and exterior of the building for bats, signs of bats and features suitable for use by roosting bats. This includes droppings, scratch marks, rubbing and staining at exit holes, live or dead bats and other features such as missing tiles, this list is not exhaustive.

The buildings suitability to support roosting bats was assessed and no potential roost features were identified during the preliminary inspection. When combined, these features along with the data from the desk top study, results in the property and attached being characterised as having negligible potential¹ to support roosting bats.

In line with best practice guidelines², no further survey effort is required.

BS5837 – Tree Surveys – Ecological Consulting

1. Introduction

1.1 Instruction

Urban Tree Experts was instructed by Mr J Pietrzak to conduct a DBW of 10 South Close, Wokingham, RG40 2DJ to support a forthcoming planning application to Wokingham Borough Council.

1.2 Aims and Objectives

The DBW is designed to:

- Identify the presence/likely absence of bats within the building.
- Provide information on previous bat ecological surveys/reports.
- Provide information on the status of bats using the building currently or previously.
- To add confidence where no bats are found, or to categorise the nature of a roost where evidence of bats are found.
- To establish whether further surveys, mitigation or an EPSL is required.

The preliminary ecological appraisal (bats) and report writing were carried out in accordance with Bat Surveys for Professional Ecologists Good Practice Guidelines 4th edition.

1.3 Proposed Works

The survey was commissioned in connection with a forthcoming planning application to Wokingham Borough Council that will seek to construct a 1st floor over the garage, convert the garage into habitable accommodation and construct a single-story extension.

1.4 Surveyor Background and Experience

The preliminary ecological appraisal for bats was completed by and report written by Simon Holmes MSc. CEnv.

Simon holds Class 3 (CL19) and 4 (CL20) Bat Licenses (Nos. 17637 and 17638) and a Science and Education license (SCI64844). He has 35 years' experience of carrying out bat surveys and bat conservation work.

2. Legislation and Planning Policy

2.1 Legislative Background

All species of British bat are protected under the Conservation of Habitats and Species Regulations 2017 and the Wildlife and Countryside Act 1981, as amended. Under this legislation it is an offence to kill or injure a bat or interfere with any roosting or resting site. A bat roost is interpreted as "*any structure or place used for shelter or protection*" whether or not bats are present at the time. A summary of the main legislation and planning considerations are included at Appendix 1.

Seven species of bat are also Species of Principal Importance for nature conservation in England under Section 41 of the Natural Environment and Rural Communities Act 2006. This places a duty on all government departments to have regard for the conservation of these species and on the Secretary of State to further, or promote others to further, the conservation of these species.

3. Site Location and Description

3.1 Site Location

The building is located at Grid Reference SU81516794, see Figure 1 below. An overview of the immediate area is shown on Figure 2, courtesy of Promap.

Figure 1. 10 South Close, Wokingham, highlighted.

Figure 2. 10 South Close, Wokingham, overview of the immediate area.

Urban Tree Experts

BS5837 – Tree Surveys – Ecological Consulting

3.2 Site Description

The application site comprises a detached, brick-built 2 storey property with attached garage. The remainder of the site comprises a driveway/parking area and front garden with lawn and flower beds/shrubs, see cover photograph. The rear garden contains a patio and is mainly laid to lawn with a number of shrubs and mature trees throughout, see Figures 3 below. The site itself offers good foraging and commuting habitat for bats and there is good ecological connectivity to bat foraging and commuting habitat in the wider landscape.

Figure 3. Rear garden. 10 South Close, Wokingham. 15.04.25

4. Survey Methodology

4.1 Pre-Survey Data Search

The client has advised that, to their knowledge, no previous bat surveys have been undertaken on this site. Google Earth and MAGIC maps (magic.defra.gov.uk) websites were used prior to the survey to determine the suitability of the surrounding habitat to support roosting bats and to identify any statutory designated sites or EPSLs within 2km of the site. Due to the suburban areas, scale of the proposed development, and the very local impact that may occur, no data was sought from the local records centre at this time.

The site is situated in a residential area to the south of the town of Wokingham and is adjacent to properties and gardens of varying sizes and styles. To the south lies large expanses of agricultural land, pockets of woodland and the Emm Brook, all of which are likely to provide good habitat to support bats and are connected to the site via ecological corridors. To the northwest lies Langborough Recreation Ground which is known to provide good habitat for bats and is within travelling distance for bats. To the north lies the town centre, with dense infrastructure, commercial and housing development, which do not provide suitable habitat for bats.

Urban Tree Experts

BS5837 – Tree Surveys – Ecological Consulting

Holt Copse and Joel Park Local Nature Reserve (LNR) lies within 2km of the site although there is no ecological connectivity from the site to this LNR. A search of the Magic interactive website revealed one current EPSL for bats has been granted within 2km of the site, the details of which are provided in Table 1 below.

Table 1. Current EPSLs for bats within 2km of the site

EPSL reference	Licence end date	Species on licence
2020-48489-EPS-MIT	12/2027	Common pipistrelle, soprano pipistrelle and brown long-eared

4.2 Daylight Survey

The DBW of 10 South Close, Wokingham, RG40 2DJ was carried out by Simon Holmes on Tuesday 15 April 2025 at 2.15pm. The weather conditions for the survey were overcast with a temperature of 14 degrees. Equipment used included a high-powered torch, a digital camera on a telescopic pole, endoscope and a ladder.

During the DBW, an external inspection of the property and attached garage was carried out to identify any signs of occupation by bats and features that could offer potential roosting sites following standard survey guidelines. Features investigated included:

- Construction of the building – soffits, loft space, tiles/slates, lead flashings etc.
- Building condition – structure of roof and walls.
- Internal conditions – microclimate stability, draughts etc.
- Access points – potential entry and exit points for bats.
- Roosting points – cracks and crevices, between underlay and roofing tiles/slates.

Field signs that would indicate the presence of bats were searched for. These included:

- Bat droppings on the floor and walls of the building.
- Feeding remains (particularly butterfly and moth wings).
- Evidence of urine and/or oily staining around possible roost entrances.
- Presence of areas cleared of cobwebs.
- Where a breathable roofing membrane has been fitted staining on the membrane may suggest use by bats.
- Odour can sometimes suggest the present of bats.
- Squeaking and chattering can reveal bats roosting between the tiles and roofing underlay.

Buildings or structures that were not to be affected by the current proposals or with no bat roosting potential were not inspected.

4.3 Constraints

Full access to the site during the visit was made possible by the client. A section of the ceiling in the side, hipped roof extension had been removed to facilitate improvements, and a thorough inspection of this void could not be undertaken however, given the excellent condition of the roof tiles externally this was not considered a significant constrain to the survey.

5. Survey Findings

5.1 External Inspection

The external features of the property and attached garage were examined for signs described in section 4.2. Windowsills, exposed features around the windows, fascias and walls were inspected for any evidence of bat droppings or staining.

The property is a detached, brick-built 2 storey property that is in a good condition externally. The hipped roof of is covered in interlocking tiles, none of which are missing or broken, see Figure 4 below. The ridge and hip tiles are all tightly fitted and had no gaps in which roosting bats could exploit, see Figure 5 on page 9. The soffits and fascias are tightly fitted to the walls and had no cracks or splits in which roosting bats could exploit, see Figure 6 on page 9. On the east elevation is an attached garage with false pitched roof behind which is a flat roof covered in membrane. The roof and ridge tiles on the false pitch roof are tightly fitted with no gaps (see Figure 7 on page 10), and the membrane is securely affixed to the main property and edges metal covered affording no roosting opportunities, see Figure 8 on page 10. At the rear of the garage is a hipped roof extension again covered in closely fitted interlocking tiles with no missing mortar from the ridge or hip tiles (see Figure 9 on page 11) and the soffits and fascias are tightly to the wall with no gaps or splits that could be exploited, see Figure 10 on page 11.

No bats or evidence of bats was recorded during the external inspection of the property or garage and externally there were no visible roosting opportunities for bats or access into the building for roosting bats.

Figure 10. Soffits and fascias on extension. 9 South Close, Wokingham. 18.06.24

5.2 Internal Inspection

An internal inspection of the property and attached garage was undertaken and was examined for any signs of bats (as described in section 4.2).

The loft space was accessed via steps through a hatch and is in a good condition internally. The loft is uncluttered, lit, partially boarded and insulated, see Figure 12 below. The roof tiles are lined with bitumen felt, all of which is in a good condition with no rips or tears, see Figure 12 below.

The garage is used for storage and in a good condition internally. The ceiling is boarded and had no cracks in which roosting bats could utilise internally, see Figure 13 on page 13. A section of the ceiling in the side, hipped roof extension had been removed to facilitate improvements (see Figure 14 on page 13), however a thorough inspection of this void could not be undertaken but, given the excellent condition of the roof tiles externally this was not considered a significant constrain to the survey.

No bats or evidence of bats was recorded during the internal inspection of the property or attached garage and internally there appeared to be no roosting opportunities for bats within either building.

6. Evaluation

The bat roost potential of the features within the site have been assessed with reference to the following criteria and include seasonal variation where increased or decreased probability may arise. Where features are present, they are **highlighted in bold**.

The likelihood of bat roosts being present will be higher where structures:

- are of a pre-20th Century construction;
- are in a lowland rural setting;
- **have woodland, mature trees, species-rich grassland and/or water nearby;**
- have large dimension roof timbers with cracks, joints and holes;
- have numerous crevices in stonework and structures;
- have an uneven roof covering with gaps, though not too draughty;
- have hanging tiles or roof cladding, especially on south-facing walls;
- **have a roof warmed by the sun;**
- are disused or little used; largely undisturbed;
- provide appropriate hibernation conditions, such as abandoned mines, tunnels, kilns, or fortifications; or
- **Recent and historical records of bat roosts in the general area.**

The likelihood of bat roosts being present will be lower where structures:

- **are in an urban setting with little green space;**
- are subject to heavy disturbance (constant movement due to draughts and noise, also unstable microclimate);
- **have a small, cluttered roof void (particularly for brown long-eared);**
- **are of a modern construction with few gaps or crevices that bats can fly or crawl through (though pipistrelle bats may still be present);**
- are comprised of prefabricated steel or sheet materials; (some sections);
- are active industrial premises.

Please note that the above list provides generic screening criteria only and there are exceptions to consider.

7. Conclusions

7.1 Interpretation

The combined evidence from the desktop study and the internal and external inspection of the property and attached garage provides a high level of confidence in support of the opinions set out in this report. There were no bats or evidence of bats and no visible features externally on the buildings which could be utilised by roosting bats or in which bats could access the buildings to roost and internally there are no potential roosting opportunities for bats.

Informed by the results of the survey and the factors highlighted in Section 6, along with the data from the desk top study, it is concluded that there is negligible potential for roosting bats within the property or attached garage. Based on recommendations in the Bat Workers Manual and the Bat Surveys Good Practice Guidelines, no further survey effort is required.

Urban Tree Experts

BS5837 – Tree Surveys – Ecological Consulting

7.2 Contingency Plan

In the unlikely event that bats are found during the proposed works, all work must stop, and advice sought from Urban Tree Experts or another licensed bat ecologist.

If, for whatever reason, there is a time delay of greater than 12 months between this survey and the commencement of work, then the survey should be repeated as the condition of the building may change and bats may start roosting at the site.

APPENDIX 1

In summary, the legislation combined makes it an offence to:

- Intentionally or recklessly damage, destroy or obstruct access to a structure or place used for shelter by a bat.
- Intentionally or recklessly disturb bats; in particular any disturbance which is likely to impair the ability of bats to survive, breed or reproduce or nurture their young; or in the case of hibernating or migrating bats, to hibernate or migrate.
- Intentionally or deliberately kill, injure or take any bat.

Planning Considerations:

Government guidance to Local Planning Authorities stipulates the need to consider biodiversity and protected species during the consideration of planning applications. The NPPF makes clear that the planning system should help minimise the impacts that development can have on biodiversity and provide net gains in biodiversity where possible. In addition, the ODPM Circular 04/2005 states *“It is essential that the presence or otherwise of protected species, and the extent that they may be affected by the proposed development, is established before the planning permission is granted, otherwise all relevant material considerations may not have been addressed in making the decision”*.

Policy CP7 of the Wokingham Borough Core Strategy (planning policy relating to the site) states *“Development which may harm habitats or, species of principle importance in England for nature conservation, veteran trees or features of the landscape that are of major importance for wild flora and fauna (including wildlife and river corridors), whether directly or indirectly will be only permitted if it has been clearly demonstrated that the need for the proposal outweighs the need to safeguard the nature conservation importance, that no alternative site that would result in less or no harm is available which will meet the need, and*

- i) Mitigation measures can be put in place to prevent damaging impacts; or*
- ii) Appropriate compensation measures to offset the scale and kind of losses are provided”*.

Developments that compromise the protection afforded to bats or roosts under the provisions of the Conservation of Habitats and Species Regulations 2017 and the Wildlife and Countryside Act 1981 will require a European Protected Species (EPS) licence from Natural England (NE).

NE, the government’s statutory conservation advisory organisation, is responsible for issuing EPS licences that would permit activities that would otherwise lead to an infringement of the Habitat Regulations.

Three tests must be satisfied before this licence (to permit otherwise prohibited acts) can be issued:

- Reg 44(2)(e) – the derogation is “in the interests of public health and public safety, or for other imperative reasons of overriding public interest, including those of a social or economic nature and beneficial consequences of primary importance for the environment”.
- Reg 44(3)(a) – there is “no satisfactory alternative” to the derogation.
- Reg 44(3)(b) –the derogation is “not detrimental to the maintenance of the populations of the species concerned at a favourable conservation status in their natural range”.

Tests (a) and (e) can be met with the issue of planning permission for the proposed works. Test (b) is determined by NE’s ecology department that requires the development of a suitable mitigation strategy that would ensure that any bats present on site, are retained at the same population level or better.
