

‘ This tree is located within a driveway and close to a house, so maintaining a regular pruning schedule maintains the tree back into scale with the surroundings area giving the property more light through windows and enough space to park vehicles into the driveway. These works are also part of a routine maintenance cycle of works, so have been carried out before, pruning branches back to previous pruning points.

Without these tree works, the Oak branches will in time start obstructing the building, block light from property windows, and the low canopy will impede on vehicles driving in and out. Regular pruning is the best way to mitigate against future issues’.
