All rights in this report are reserved. No part of it may be reproduced, edited or transmitted, in any form or by any means, electronic, mechanical, photocopying, recording or otherwise, or stored in any retrieval system of any nature, without our written permission. Its content and format are for the exclusive use of Mr M Duffin and his agents in dealing with this site. It may not be sold, lent, hired out or divulged to any third party not directly involved in this site without the written consent of Urban Tree Experts. It may be reproduced as part of a planning application.

This report is valid for 12 months from the site inspection. The lifespan of this report may be subject to change if the site conditions change due to unspecified works that affect the site.

Executive Summary

Urban Tree Experts was commissioned by Mr M Duffin to conduct a preliminary ecological appraisal (daytime bat walkover [DBW]) of 8 Hunters Way, Spencers Wood, Wokingham, RG7 1HW. This is to support a forthcoming planning application to Wokingham Borough Council.

The site visit was carried out on Wednesday 28 August 2024 at 10.30am, during daylight hours. An internal and external inspection of the property and attached garage took place to look for signs of bats.

The preliminary ecological appraisal consists of a desk top study prior to the survey to review existing information about the site and its surroundings and to inform the design of subsequent bat surveys, if required. The desk top study was conducted based upon a minimum 2km search radius and it revealed one statutory designated site is located and three current European Protected Species Licences (EPSLs) for bats have been granted within 2km of the proposed development site. The surrounding habitat, with woodland, farmland and grassland provide rich and diverse habitats suitable for a wide range of bat species and there is good ecological connectivity to these areas from the site.

The DBW comprised a detailed search of the interior and exterior of the building for bats, signs of bats and features suitable for use by roosting bats. This includes droppings, scratch marks, rubbing and staining at exit holes, live or dead bats and other features such as missing tiles, this list is not exhaustive.

The buildings suitability to support roosting bats was assessed and no potential roost features were identified during the preliminary inspection. When combined, this lack of features along with the data from the desk top study results in the property and attached garage being characterised as having negligible potential¹ to support roosting bats.

In line with best practice guidelines², no further survey effort is required.

1. Introduction

1.1 Instruction

Urban Tree Experts was instructed by Mr M Duffin to conduct a DBW of 8 Hunters Way, Spencers Wood, Wokingham, RG7 1HW to support a forthcoming planning application to Wokingham Borough Council.

1.2 Aims and Objectives

The DBW is designed to:

- Identify the presence/likely absence of bats within the building.
- Provide information on previous bat ecological surveys/reports.
- Provide information on the status of bats using the building currently or previously).
- To add confidence where no bats are found, or to categorise the nature of a roost where evidence of bats are found.
- To establish whether further surveys, mitigation or an EPSL is required.

The preliminary ecological appraisal (bats) and report writing were carried out in accordance with Bat Surveys for Professional Ecologists Good Practice Guidelines 4th edition.

1.3 Proposed Works

The survey was commissioned in connection with a forthcoming planning application to Wokingham Borough Council that will seek to construct a first-floor extension and convert the loft into habitable accommodation.

1.4 Surveyor Background and Experience

The preliminary ecological appraisal for bats was completed by Nick Powell and the report was written by Simon Holmes MSc. CEnv.

Nick commenced surveying bats in 2022 and holds a Class 2 Bat License (CLS-11742) and has received training in bat ecology and surveying, bat detector use, acoustic monitoring/sonogram analysis, architectural terms for bat workers, bats and development, H & S awareness for bat workers, legislation for bat workers, British bats their ecology and conservation, surveying trees for bats, Bat ID and handling, bat biology.

Simon holds Class 3 (CL19) and 4 Bat (CL20) Licenses (Nos. 17637 and 17638) and a Science and Education license (SCI64844). He has 34 years' experience of carrying out bat surveys and bat conservation work.

2. Legislation and Planning Policy

2.1 Legislative Background

All species of British bat are protected under the Conservation of Habitats and Species Regulations 2017 and the Wildlife and Countryside Act 1981, as amended. Under this legislation it is an offence to kill or injure a bat or interfere with any roosting or resting site. A bat roost is interpreted as "*any structure or place used for shelter or protection*" whether or not bats are present at the time. A summary of the main legislation and planning considerations are included at Appendix 1.

Urban Tree Experts

BS5837 – Tree Surveys – Ecological Consulting

Seven species of bat are also Species of Principal Importance for nature conservation in England under Section 41 of the Natural Environment and Rural Communities Act 2006. This places a duty on all government departments to have regard for the conservation of these species and on the Secretary of State to further, or promote others to further, the conservation of these species.

3. Site Location and Description

3.1 Site Location

The building is located at Grid Reference SU 7160 6644, see Figure 1 below. An overview of the immediate area is shown on Figure 2, courtesy of Bing Maps.

Figure 1. 8 Hunters Way, Spencers Wood, highlighted.

Figure 2. 8 Hunters Way, Spencers Wood, overview of the immediate area.

Urban Tree Experts

BS5837 – Tree Surveys – Ecological Consulting

3.2 Site Description

The application site comprises a detached, brick-built property with an attached garage. The remainder of the site comprises a front garden (see Figure 3 below) and a rear garden with patio area and lawn. The site itself offers limited foraging and commuting habitat for bats although there is some ecological connectivity to bat foraging and commuting habitat in the wider landscape.

Figure 3. Front garden. 8 Hunters Way, Spencers Wood. 28.08.24

4. Survey Methodology

4.1 Pre-Survey Data Search

The client has advised that, to their knowledge, no previous bat surveys have been undertaken at this site. Google Earth and MAGIC maps (magic.defra.gov.uk) websites were used prior to the survey to determine the suitability of the surrounding habitat to support roosting bats and to identify any statutory designated sites or EPSLs within 2km of the site. Due to the scale of the proposed development, and the very local impact that may occur, no data was sought from the local records centre at this time.

The application site is situated in the village of Spencers Wood and is surrounded by properties and gardens of similar sizes and styles. To the south lies a large area of farmland and to the west areas of farmland and woodland, all of which are likely to provide good habitat to support roosting, commuting and foraging bats and are connected to the site via the rear garden. Large areas of farmland and woodland lie in close proximity to the site, which contain good habitat to support bats and are connected to the site by ecological corridors.

Urban Tree Experts

BS5837 – Tree Surveys – Ecological Consulting

The River Loddon runs to the east and south of the site, which is known to provide good habitat to support bats and have good ecological connectivity to the site. Further afield lie areas of woodland, farmland and parkland, all of which are likely to provide good habitat for roosting, commuting and foraging bats and there are ecological corridors connecting the site these sites.

Stanford End Mill and River Loddon Site of Special Scientific Interest (SSSI) lies within 2km of the proposed development site and there is good ecological connectivity from the site to this SSSI. A search of the Magic interactive website revealed three current EPSLs for bats has been granted within 2km of the site, the details of which are provided in Table 1 below.

Table 1. Current EPSLs for bats within 2km of the site

EPSL reference	Licence end date	Species on licence
2016-25203-EPS-MIT	09/2026	Common pipistrelle and brown long-eared
2018-36705-EPS-MIT	10/2028	Common pipistrelle and brown long-eared
2018-36705-EPS-MIT-1	10/2028	Common pipistrelle and brown long-eared

4.2 Daylight Survey

The DBW of 8 Hunters Way, Spencers Wood, Wokingham, RG7 1HW was carried out by Nick Powell on Wednesday 28 August 2024 at 10.30am. The weather conditions for the survey were sunny with a temperature of 24 degrees. Equipment used included a high-powered torch, a digital camera on a telescopic pole, endoscope and a ladder.

During the DBW, an internal and external inspection of the property and attached garage was carried out to identify any signs of occupation by bats and features that could offer potential roosting sites following standard survey guidelines. Features investigated included:

- Construction of the building– soffits, loft space, tiles/slates, lead flashings etc.
- Building condition – structure of roof and walls.
- Internal conditions – microclimate stability, draughts etc.
- Access points – potential entry and exit points for bats.
- Roosting points – cracks and crevices, between underlay and roofing tiles/slates.

Field signs that would indicate the presence of bats were searched for. These included:

- Bat droppings on the floor and walls of the building.
- Feeding remains (particularly butterfly and moth wings).
- Evidence of urine and/or oily staining around possible roost entrances.
- Presence of areas cleared of cobwebs.
- Where a breathable roofing membrane has been fitted staining on the membrane may suggest use by bats.
- Odour can sometimes suggest the present of bats.
- Squeaking and chattering can reveal bats roosting between the tiles and roofing underlay.

Buildings or structures that were not to be affected by the current proposals or with no bat roosting potential were not inspected.

4.3 Constraints

Full access to the site during the visit was made possible by the client and there were no constraints to the survey.

5. Survey Findings

5.1 External Inspection

The external features of the property and attached garage were examined for signs described in section 4.2. Windowsills, exposed features around the windows, fascias and walls were inspected for any evidence of bat droppings or staining.

The property is a detached, brick-built property with rear, single storey extension and an attached garage, all of which are in a good condition externally. The roof of the property is pitched and covered in closely fitted tiles, none of which are missing or broken, see Figure 4 below. The ridge tiles are all tightly fitted and had no gaps in which roosting bats could exploit (see Figure 5 on page 9) and the verges are all well cemented with no cracks or splits in which crevice dwelling bats could use for roosting. The hip tiles on the roof section above the garage are all closely fitted with no gaps in which roosting bats could utilise (see Figure 6 on page 9), and the lead flashing affixing it to the main property and around the chimney is all tightly fitted with no gaps, see Figure 7 on page 10. The soffits and fascias are tightly fitted to the walls and have no visible gaps in which bats could use for roosting, see Figure 8 on page 10. The pitched roof of the rear, single storey extension is covered in close fitted slate tiles, there is no missing mortar from the verges and the ridge tiles and sealed with ridge clips, see Figure 9 on page 11. The lead flashing around the Velux window and affixing the building to the main property is flush with no gaps and the soffits and fascias are sealed with no splits, see Figure 10 on page 11.

No bats or evidence of bats was recorded during the external inspection of the property or attached garage and externally there were no visible roosting opportunities for bats or access into the building for roosting bats.

5.2 Internal Inspection

An internal inspection of the property and attached garage was undertaken and was examined for any signs of bats (as described in section 4.2).

There were two loft spaces, one within the main dwelling and one above the attached garage.

The loft space in the main property was accessed through a hatch via a loft ladder and is in a good condition internally, see Figure 11 below. The loft is used for storage, lit, boarded and insulated, see Figure 12 on page 13. The roof tiles are lined with bitumen felt, all of which is in a good condition with no rips or tears in which roosting bats could exploit, see Figure 13 on page 13.

The loft of the garage was also accessed through a hatch via a ladder (see Figure 14 on page 14), is small, uncluttered and also in a good condition, see Figure 15 on page 14. The roof tiles are lined with bitumen felt, all of which is in a good condition with no rips or tears in which roosting bats could exploit, see Figure 16 on page 15.

No bats or evidence of bats was recorded during the internal inspection of the property and internally there appeared to be no roosting opportunities for bats within the building.

6. Evaluation

The bat roost potential of the features within the site have been assessed with reference to the following criteria and include seasonal variation where increased or decreased probability may arise. Where features are present, they are **highlighted in bold**.

The likelihood of bat roosts being present will be higher where structures:

- are of a pre-20th Century construction;
- are in a lowland rural setting;
- **have woodland, mature trees, species-rich grassland and/or water nearby;**
- have large dimension roof timbers with cracks, joints and holes;
- have numerous crevices in stonework and structures;
- have an uneven roof covering with gaps, though not too draughty;
- have hanging tiles or roof cladding, especially on south-facing walls;
- **have a roof warmed by the sun;**
- are disused or little used; largely undisturbed;
- provide appropriate hibernation conditions, such as abandoned mines, tunnels, kilns, or fortifications; or
- **Recent and historical records of bat roosts in the general area.**

Urban Tree Experts

BS5837 – Tree Surveys – Ecological Consulting

The likelihood of bat roosts being present will be lower where structures:

- are in an urban setting with little green space;
- are subject to heavy disturbance (constant movement due to draughts and noise, also unstable microclimate);
- **have a small, cluttered roof void (particularly for brown long-eared);**
- **are of a modern construction with few gaps or crevices that bats can fly or crawl through (though pipistrelle bats may still be present);**
- are comprised of prefabricated steel or sheet materials; (some sections);
- are active industrial premises.

Please note that the above list provides generic screening criteria only and there are exceptions to consider.

7. Conclusions

7.1 Interpretation

The combined evidence from the desktop study and the internal and external inspection of the property and attached garage provides a high level of confidence in support of the opinions set out in this report. There are no visible features externally on the building which could be utilised by roosting bats or in which bats could access the building to roost and internally there are no potential roosting opportunities for bats.

Informed by the results of the survey and the factors highlighted in Section 6, it is concluded that there is negligible potential for roosting bats within the property or garage. Based on recommendations in the Bat Workers Manual and the Bat Surveys Good Practice Guidelines, no further survey effort is required.

7.2 Contingency Plan

In the unlikely event that bats are found during the proposed works, all work must stop, and advice sought from Urban Tree Experts or another licensed bat ecologist.

If, for whatever reason, there is a time delay of greater than 12 months between this survey and the commencement of work, then the survey should be repeated as the condition of the building may change and bats may start roosting at the site.

APPENDIX 1

In summary, the legislation combined makes it an offence to:

- Intentionally or recklessly damage, destroy or obstruct access to a structure or place used for shelter by a bat.
- Intentionally or recklessly disturb bats; in particular any disturbance which is likely to impair the ability of bats to survive, breed or reproduce or nurture their young; or in the case of hibernating or migrating bats, to hibernate or migrate.
- Intentionally or deliberately kill, injure or take any bat.

Planning Considerations:

Government guidance to Local Planning Authorities stipulates the need to consider biodiversity and protected species during the consideration of planning applications. The NPPF makes clear that the planning system should help minimise the impacts that development can have on biodiversity and provide net gains in biodiversity where possible. In addition, the ODPM Circular 04/2005 states *“It is essential that the presence or otherwise of protected species, and the extent that they may be affected by the proposed development, is established before the planning permission is granted, otherwise all relevant material considerations may not have been addressed in making the decision”*.

Policy CP7 of the Wokingham Borough Core Strategy (planning policy relating to the site) states *“Development which may harm habitats or, species of principle importance in England for nature conservation, veteran trees or features of the landscape that are of major importance for wild flora and fauna (including wildlife and river corridors), whether directly or indirectly will be only permitted if it has been clearly demonstrated that the need for the proposal outweighs the need to safeguard the nature conservation importance, that no alternative site that would result in less or no harm is available which will meet the need, and*

- i) Mitigation measures can be put in place to prevent damaging impacts; or*
- ii) Appropriate compensation measures to offset the scale and kind of losses are provided”*.

Developments that compromise the protection afforded to bats or roosts under the provisions of the Conservation of Habitats and Species Regulations 2017 and the Wildlife and Countryside Act 1981 will require a European Protected Species (EPS) licence from Natural England (NE).

NE, the government’s statutory conservation advisory organisation, is responsible for issuing EPS licences that would permit activities that would otherwise lead to an infringement of the Habitat Regulations.

Three tests must be satisfied before this licence (to permit otherwise prohibited acts) can be issued:

- Reg 44(2)(e) – the derogation is “in the interests of public health and public safety, or for other imperative reasons of overriding public interest, including those of a social or economic nature and beneficial consequences of primary importance for the environment”.
- Reg 44(3)(a) – there is “no satisfactory alternative” to the derogation.
- Reg 44(3)(b) –the derogation is “not detrimental to the maintenance of the populations of the species concerned at a favourable conservation status in their natural range”.

Tests (a) and (e) can be met with the issue of planning permission for the proposed works. Test (b) is determined by NE’s ecology department that requires the development of a suitable mitigation strategy that would ensure that any bats present on site, are retained at the same population level or better.
