

my concerns for the apartment being built to the rear of the garden are as follows.

the project is being built within the root structure and canopy of the oak trees to the rear of there garden these trees are a home to some lovely wildlife Owls Red kites and roosts for wood pigeons and other birds.

i would like more information with regards to the wood screws they intend to use as i wouldn't want anything to destabilise the tree as it could potentially fall onto my property.

these trees also provide an element of screening to the property and add an element of privacy they also provide fresh air.

i don't object to them building closer to there house out of the root system of these oak trees

maybe they could have included the plans for this with the plans for the extension and building over there indoor pool that they have already made

how much more disturbance do we need
