All rights in this report are reserved. No part of it may be reproduced, edited or transmitted, in any form or by any means, electronic, mechanical, photocopying, recording or otherwise, or stored in any retrieval system of any nature, without our written permission. Its content and format are for the exclusive use of Mr R G Ali and his agents in dealing with this site. It may not be sold, lent, hired out or divulged to any third party not directly involved in this site without the written consent of Urban Tree Experts. It may be reproduced as part of a planning application.

This report is valid for 12 months from the site inspection. The lifespan of this report may be subject to change if the site conditions change due to unspecified works that affect the site.

Executive Summary

Urban Tree Experts was commissioned by Mr R G Ali to conduct a preliminary ecological appraisal (daytime bat walkover [DBW]), of 108 Reading Road, Woodley, RG5 3AD. This is to support a forthcoming planning application to Wokingham Borough Council.

The site visit was carried out on Friday 10 January 2025 at 12.30pm, during daylight hours. An internal and external inspection of the property took place to look for signs of bats.

The preliminary ecological appraisal consists of a desk top study prior to the survey to review existing information about the site and its surroundings and to inform the design of subsequent bat surveys, if required. The desk top study was conducted based upon a minimum 2km search radius and it revealed three statutory designated sites are located within, and three current European Protected Species Licences (EPSLs) for bats have been granted within 2km of the proposed development site. The immediate surrounding habitat does not provide suitable habitat for roosting, commuting or foraging bats due to the dense urban design however, there is good ecological connectivity to allotments and parks via the garden network.

The DBW comprised a detailed search of the interior and exterior of the buildings for bats, signs of bats and features suitable for use by roosting bats. This includes droppings, scratch marks, rubbing and staining at exit holes, live or dead bats and other features such as missing tiles, this list is not exhaustive.

The buildings suitability to support roosting bats was assessed and a potential roost feature identified during the preliminary inspection. The property is in a good to fair condition internally and externally. There is a missing roof tile from beneath the chimney stack on the east elevation which could provide potential roosting opportunities or access into the building for bats and the presence or absence of bats could not be established. When combined with the data from the desk top study, this resulted in the building being characterised as having a low potential¹ to support roosting bats.

In line with best practice guidelines², a single separate dusk emergence survey is required on the property in order to establish the presence or absence of bats. If bats are recorded roosting during this survey, further survey effort and mitigation will be required in order for the proposed development to proceed legally.

BS5837 – Tree Surveys – Ecological Consulting

1. Introduction

1.1 Instruction

Urban Tree Experts was instructed by Mr R G Ali to conduct a DBW of 108 Reading Road, Woodley, RG5 3AD to support a forthcoming planning application to Wokingham Borough Council.

1.2 Aims and Objectives

The DBW is designed to:

- Identify the presence/likely absence of bats within the building.
- Provide information on previous bat ecological surveys/reports.
- Provide information on the status of bats using the building currently or previously).
- To add confidence where no bats are found, or to categorise the nature of a roost where evidence of bats are found.
- To establish whether further surveys, mitigation or an EPSL is required.

The preliminary ecological appraisal (bats) and report writing were carried out in accordance with Bat Surveys for Professional Ecologists Good Practice Guidelines 4th edition.

1.3 Proposed Works

The survey was commissioned in connection with a forthcoming planning application to Wokingham Borough Council that will seek to convert the loft into habitable accommodation.

1.4 Surveyor Background and Experience

The preliminary ecological appraisal for bats was undertaken by Nick Powell and the report written by Simon Holmes MSc. CEnv.

Nick Powell. Nick commenced surveying bats in 2022 and holds a Class 2 Bat License (CLS-11742) and has received training in bat ecology and surveying, bat detector use, acoustic monitoring/sonogram analysis, architectural terms for bat workers, bats and development, H & S awareness for bat workers, legislation for bat workers, British bats their ecology and conservation, surveying trees for bats, Bat ID and handling, bat biology.

Simon holds Class 3 (CL19) and 4 Bat (CL20) Licenses (Nos. 17637 and 17638) and a Science and Education license (SCI-64844). He has 35 years' experience of carrying out bat surveys and bat conservation work.

2. Legislation and Planning Policy

2.1 Legislative Background

All species of British bat are protected under the Conservation of Habitats and Species Regulations 2017 and the Wildlife and Countryside Act 1981, as amended. Under this legislation it is an offence to kill or injure a bat or interfere with any roosting or resting site. A bat roost is interpreted as “*any structure or place used for shelter or protection*” whether or not bats are present at the time. A summary of the main legislation and planning considerations are included at Appendix 1.

Urban Tree Experts

BS5837 – Tree Surveys – Ecological Consulting

Seven species of bat are also Species of Principal Importance for nature conservation in England under Section 41 of the Natural Environment and Rural Communities Act 2006. This places a duty on all government departments to have regard for the conservation of these species and on the Secretary of State to further, or promote others to further, the conservation of these species.

3. Site Location and Description

3.1 Site Location

The building is located at Grid Reference SU 75667379, see Figure 1 below. An overview of the immediate area is shown on Figure 2, courtesy of Bing Maps.

Figure 1. 108 Reading Road, Woodley, highlighted.

Figure 2. 108 Reading Road, Woodley, overview of the immediate area.

Urban Tree Experts

BS5837 – Tree Surveys – Ecological Consulting

3.2 Site Description

The application site comprises a detached, brick-built bungalow with a detached building in the rear garden. The remainder of the site comprises a front garden that is mainly laid to lawn with occasional trees and shrubs and a paved parking area, see cover photograph. The rear garden, which contains a patio area, a detached brick building, timber summer house and lawn with some shrubs and trees throughout, see Figure 3 below. The site itself offers some foraging and commuting habitat for bats however there is ecological connectivity to nearby allotments and parks.

Figure 3. Rear garden. 108 Reading Road, Woodley. 10.01.25

4. Survey Methodology

4.1 Pre-Survey Data Search

The client has advised that, to their knowledge, no previous bat surveys have been undertaken on this site. Google Earth and MAGIC maps (magic.defra.gov.uk) websites were used prior to the survey to determine the suitability of the surrounding habitat to support roosting bats and to identify any statutory designated sites or EPSLs within 2km of the site. Due to the scale of the proposed development, and the very local impact that may occur, no data was sought from the local records centre at this time.

The property is situated the town of Woodley, approximately 4 miles east of Reading and is adjacent to properties and gardens of varying sizes and styles. To the east lies Woodford Park which extends to a small agricultural field and to the west are allotments which connect to Bulmershe Park, all of which are likely to provide good habitat to support roosting, foraging and commuting bats and are within travelling distance for bats. Dinton Pastures Country Park lies to the southeast, which is known to provide good habitat for roosting, commuting and foraging bats, although housing developments and main roads separate the site from this area.

Urban Tree Experts

BS5837 – Tree Surveys – Ecological Consulting

Ali's Pond Local Nature Reserve (LNR), Alder Moors LNR and Highwood LNR lie within 2km of the proposed development site although there is no ecological connectivity from the site to these LNRs due to the intervening built environment. A search of the Magic interactive website revealed three current EPSLs for bats have been granted within 2km of the site, the details of which are provided in Table 1 below.

Table 1. Current EPSLs for bats within 2km of the site

EPSL reference	Licence end date	Species on licence
2020-48093-EPS-MIT	02/2026	Common and soprano pipistrelle and brown long-eared
2020-48353-EPS-MIT	02/2026	Soprano pipistrelle
2020-48694-EPS-MIT	12/2025	Common and soprano pipistrelle

4.2 Daylight Survey

The DBW of 108 Reading Road, Woodley, RG5 3AD was carried out by Nick Powell on Friday 10 January 2025 at 12.30pm. The weather conditions for the survey were bright with a temperature of -3 degrees. Equipment used included a high-powered torch, a digital camera on a telescopic pole, endoscope and a ladder.

During the DBW an external inspection of the property was carried out to identify any signs of occupation by bats and features that could offer potential roosting sites following standard survey guidelines. Features investigated included:

- Construction of the building – soffits, loft space, tiles/slates, lead flashings etc.
- Building condition – structure of roof and walls.
- Internal conditions – microclimate stability, draughts etc.
- Access points – potential entry and exit points for bats.
- Roosting points – cracks and crevices, between underlay and roofing tiles/slates.

Field signs that would indicate the presence of bats were searched for. These included:

- Bat droppings on the floor and walls of the building.
- Feeding remains (particularly butterfly and moth wings).
- Evidence of urine and/or oily staining around possible roost entrances.
- Presence of areas cleared of cobwebs.
- Where a breathable roofing membrane has been fitted staining on the membrane may suggest use by bats.
- Odour can sometimes suggest the present of bats.
- Squeaking and chattering can reveal bats roosting between the tiles and roofing underlay.

Buildings or structures that were not to be affected by the current proposals or with no bat roosting potential were not inspected. This includes the detached brick building and timber summer house in the rear garden.

4.3 Constraints

Full access to the site during the visit was made possible by the client. A thorough inspection of the loft could not be undertaken due to the lack of boarding and thick insulation.

5. Survey Findings

5.1 External Inspection

The external features of the property were examined for signs described in section 4.2. Windowsills, exposed features around the windows, fascias and walls were inspected for any evidence of bat droppings or staining.

The property is a detached, brick-built and part rendered bungalow that is in a good to fair condition externally. The majority of the multi-pitched roof is covered in close fitting tiles, none of which are missing or broken (see Figure 4 below) however, there is a slipped tile from the bottom of the chimney stack on the east elevation, see Figure 5 on page 9. The ridge/hip tiles and valleys are all in a good condition (see Figure 6 on page 9), as is the lead flashing around the chimney on the west elevation and offers no gaps in which crevice dwelling bats could utilise for roosting, see Figure 7 on page 10. The uPVC soffits and fascias are all tightly fitted to the walls and had no cracks or splits which could be used by roosting bats, see Figure 8 on page 10.

No bats or evidence of bats was recorded during the external inspection of the property however the slipped tile on the east elevation offers potential roosting opportunities for bats or access into the building for roosting bats.

Figure 8. Example sealed uPVC soffits and fascias. 108 Reading Road, Woodley. 10.01.25

5.2 Internal Inspection

An internal inspection of the property was undertaken and was examined for any signs of bats (as described in section 4.2).

The loft was accessed through a hatch via a loft ladder and is in a fair condition. The loft is partially lit, partially boarded and deeply insulated, see Figure 9 below. Some of the roof tiles are unlined and some have been boarded, see Figure 9 below and Figure 10 on page 12.

No bats or evidence of bats was recorded during the internal inspection of the loft however roosting internally could not be excluded due to the loft being part lined with hardboard.

Figure 9. Example of loft space. 108 Reading Road, Woodley. 10.01.25

Figure 10. Example of boarding loft. 108 Reading Road, Woodley. 10.01.25

6. Evaluation

The bat roost potential of the features within the site have been assessed with reference to the following criteria and include seasonal variation where increased or decreased probability may arise. Where features are present, they are **highlighted in bold**.

The likelihood of bat roosts being present will be higher where structures:

- are of a pre-20th Century construction;
- are in a lowland rural setting;
- **have woodland, mature trees**, species-rich grassland **and/or water nearby**;
- have large dimension roof timbers with cracks, joints and holes;
- have numerous crevices in stonework and structures;
- have an uneven roof covering with gaps, though not too draughty;
- have hanging tiles or roof cladding, especially on south-facing walls;
- **have a roof warmed by the sun**;
- are disused or little used; largely undisturbed;
- provide appropriate hibernation conditions, such as abandoned mines, tunnels, kilns, or fortifications; or
- **Recent and historical records of bat roosts in the general area.**

The likelihood of bat roosts being present will be lower where structures:

- **are in an urban setting with little green space**;
- are subject to heavy disturbance (constant movement due to draughts and noise, also unstable microclimate);
- have a small, cluttered roof void (particularly for brown long-eared);
- **are of a modern construction with few gaps or crevices that bats can fly or crawl through (though pipistrelle bats may still be present)**;
- are comprised of prefabricated steel or sheet materials; (some sections);
- are active industrial premises.

Please note that the above list provides generic screening criteria only and there are exceptions to consider.

Urban Tree Experts

BS5837 – Tree Surveys – Ecological Consulting

7. Conclusions

7.1 Interpretation

No bats or evidence of bats was recorded during the survey however a thorough inspection of the loft space was not possible due to a lack of boarding and thick insulation and the presence or absence of bats could not be determined. The missing tile from beneath the chimney stack on the east elevation could provide a crevice like feature suitable for bats to roost and may provide access into the loft of the building for bats.

Based on the Bat Workers Manual and the Bat Surveys Good Practice Guidelines, one dusk emergence survey must be undertaken on the property, between May and August, in order to establish the presence or absence of roosting bats at the property. The feature identified will require 1 survey position equipped with a bat detector and night vision camera in order to cover the potential bat roosting feature.

7.2 Contingency Plan

If, for whatever reason, there is a time delay of greater than 12 months between this survey and the commencement of work, then the survey should be repeated as the condition of the building may change and the site may become more suitable to support roosting bats.

APPENDIX 1

In summary, the legislation combined makes it an offence to:

- Intentionally or recklessly damage, destroy or obstruct access to a structure or place used for shelter by a bat.
- Intentionally or recklessly disturb bats; in particular any disturbance which is likely to impair the ability of bats to survive, breed or reproduce or nurture their young; or in the case of hibernating or migrating bats, to hibernate or migrate.
- Intentionally or deliberately kill, injure or take any bat.

Planning Considerations:

Government guidance to Local Planning Authorities stipulates the need to consider biodiversity and protected species during the consideration of planning applications. The NPPF makes clear that the planning system should help minimise the impacts that development can have on biodiversity and provide net gains in biodiversity where possible. In addition, the ODPM Circular 04/2005 states *“It is essential that the presence or otherwise of protected species, and the extent that they may be affected by the proposed development, is established before the planning permission is granted, otherwise all relevant material considerations may not have been addressed in making the decision”*.

Policy CP7 of the Wokingham Borough Core Strategy (planning policy relating to the site) states *“Development which may harm habitats or, species of principle importance in England for nature conservation, veteran trees or features of the landscape that are of major importance for wild flora and fauna (including wildlife and river corridors), whether directly or indirectly will be only permitted if it has been clearly demonstrated that the need for the proposal outweighs the need to safeguard the nature conservation importance, that no alternative site that would result in less or no harm is available which will meet the need, and*

- i) Mitigation measures can be put in place to prevent damaging impacts; or*
- ii) Appropriate compensation measures to offset the scale and kind of losses are provided”*.

Developments that compromise the protection afforded to bats or roosts under the provisions of the Conservation of Habitats and Species Regulations 2017 and the Wildlife and Countryside Act 1981 will require a European Protected Species (EPS) licence from Natural England (NE).

NE, the government’s statutory conservation advisory organisation, is responsible for issuing EPS licences that would permit activities that would otherwise lead to an infringement of the Habitat Regulations.

Three tests must be satisfied before this licence (to permit otherwise prohibited acts) can be issued:

- Reg 44(2)(e) – the derogation is “in the interests of public health and public safety, or for other imperative reasons of overriding public interest, including those of a social or economic nature and beneficial consequences of primary importance for the environment”.
- Reg 44(3)(a) – there is “no satisfactory alternative” to the derogation.
- Reg 44(3)(b) –the derogation is “not detrimental to the maintenance of the populations of the species concerned at a favourable conservation status in their natural range”.

Tests (a) and (e) can be met with the issue of planning permission for the proposed works. Test (b) is determined by NE’s ecology department that requires the development of a suitable mitigation strategy that would ensure that any bats present on site, are retained at the same population level or better.
