

## 2, The Rise

### Verification of application evidence

#### T1

These photos below demonstrate why the work has been requested for this tree. The tree is in decline, heavily weighted towards the property and with a large amount of deadwood present. I have proposed the large lower limb to be reduce and brought back to the small amount of live material approximately 2-3m from the main union. The danger being this would not split from the union but snap out over vehicle property in high winds. Tree also has a lot of dead material around the rest of the canopy. Particularly in the top where one of the two leaders has died off. I also believe reducing the height by 1-2 m will protect the tree from any further wind related damage.

#### T2

Tree just needs a lift over the road as larger vehicles, mostly waste collection vehicles has struggled to fit underneath it without damaging them. Recommend lifting the tree up to 4.5m.

I the agent, Nicholas Harris of NGH Tree Care, affidavit that the work herby requested is correct and to the best of my knowledge is the best practice of work for the protected trees in the area TPO-0540-1991
