This report is valid for 12 months from the site inspection. The lifespan of this report may be subject to change if the site conditions change due to unspecified works that affect the site.

Urban Tree Experts

BS5837 – Tree Surveys – Ecological Consulting

Executive Summary

Urban Tree Experts was commissioned by Ms C Salt to conduct a preliminary ecological appraisal (daytime bat walkover [DBW]), of 7 Buckhurst Grove, Wokingham RG40 2JR. This is to support a forthcoming planning application to Wokingham Borough Council.

The site visit was carried out on Tuesday 8 July 2025 at 10am, during daylight hours. An internal and external inspection of the property took place to look for signs of bats.

The preliminary ecological appraisal consists of a desk top study prior to the survey to review existing information about the site and its surroundings and to inform the design of subsequent bat surveys, if required. The desk top study was conducted based upon a minimum 2km search radius and it revealed that no statutory designated sites are located within, and no current European Protected Species Licence (EPSL) for bats has been granted within 2km of the proposed development site. The immediate urban surroundings do not provide good roosting, foraging or commuting habitat for bats but further afield to the south are areas of woodland and agricultural land/improved grassland and Emm Brook providing rich and diverse habitats suitable for a wide range of bat species and they are connected to the site via the back garden network.

The DBW comprised a detailed search of the interior and exterior of the building for bats, signs of bats and features suitable for use by roosting bats. This includes droppings, scratch marks, rubbing and staining at exit holes, live or dead bats and other features such as missing tiles, this list is not exhaustive.

The buildings suitability to support roosting bats was assessed and no potential roost features were identified during the preliminary inspection. The findings from the DBW and data from the desk top study results in the building being characterised as having a negligible potential¹ to support roosting bats.

In line with best practice guidelines², no further survey effort is required.

BS5837 – Tree Surveys – Ecological Consulting

1. Introduction

1.1 Instruction

Urban Tree Experts was instructed by Ms C Salt to conduct a DBW of 7 Buckhurst Grove, Wokingham RG40 2JR to support a forthcoming planning application to Wokingham Borough Council.

1.2 Aims and Objectives

The DBW is designed to:

- Identify the presence/likely absence of bats within the building.
- Provide information on previous bat ecological surveys/reports.
- Provide information on the status of bats using the buildings currently or previously).
- To add confidence where no bats are found, or to categorise the nature of a roost where evidence of bats are found.
- To establish whether further surveys, mitigation or an EPSL is required.

The preliminary ecological appraisal (bats) and report writing were carried out in accordance with Bat Surveys for Professional Ecologists Good Practice Guidelines 4th edition.

1.3 Proposed Works

The survey was commissioned in connection with a forthcoming planning application to Wokingham Borough Council, the final details of which were unknown at the time of writing the report.

1.4 Surveyor Background and Experience

The preliminary ecological appraisal for bats was completed by Nick Powell and the report was written by Simon Holmes MSc. CEnv.

Nick holds a Class 2 Bat License (CLS-11742) and has been surveying bats for 3 years with various ecological consultancies and has received training in surveying techniques, bat detector use, bat biology, identification, acoustic monitoring, echolocation analysis and netting.

Simon holds Class 3 (CL19) and 4 Bat (CL20) Licenses (Nos. 17637 and 17638) and a Science and Education license (SCI64844). He has 35 years' experience of carrying out bat surveys and bat conservation work.

2. Legislation and Planning Policy

2.1 Legislative Background

All species of British bat are protected under the Conservation of Habitats and Species Regulations 2017 and the Wildlife and Countryside Act 1981, as amended. Under this legislation it is an offence to kill or injure a bat or interfere with any roosting or resting site. A bat roost is interpreted as "*any structure or place used for shelter or protection*" whether or not bats are present at the time. A summary of the main legislation and planning considerations are included at Appendix 1.

Urban Tree Experts

BS5837 – Tree Surveys – Ecological Consulting

Seven species of bat are also Species of Principal Importance for nature conservation in England under Section 41 of the Natural Environment and Rural Communities Act 2006. This places a duty on all government departments to have regard for the conservation of these species and on the Secretary of State to further, or promote others to further, the conservation of these species.

3. Site Location and Description

3.1 Site Location

The building is located at Grid Reference SU82616821, see Figure 1 below. An overview of the immediate area is shown on Figure 2, courtesy of Bing Maps.

Figure 1. 7 Buckhurst Grove, Wokingham, highlighted.

Figure 2. 7 Buckhurst Grove, Wokingham, overview of the immediate area.

Urban Tree Experts

BS5837 – Tree Surveys – Ecological Consulting

3.2 Site Description

The application site comprises a detached, brick-built property with detached garage at the rear. The remainder of the site comprises paved driveway/parking areas at the front and a rear garden that is mainly laid to lawn with a patio/seating area and mature trees on the boundaries, see Figure 3 below. The site itself offers some foraging and commuting habitat for bats and there is some ecological connectivity to the wider landscape, but this is restricted due to the urban nature of surrounding environment.

Figure 3. Rear garden. 7 Buckhurst Grove, Wokingham. 08.07.25

4. Survey Methodology

4.1 Pre-Survey Data Search

The client advised that, to their knowledge, no previous bat surveys have been conducted on the property. Google Earth and MAGIC maps (magic.defra.gov.uk) websites were used prior to the survey to determine the suitability of the surrounding habitat to support roosting bats and to identify any statutory designated sites or EPSLs within 2km of the site. Due to the urban area, scale of the proposed development, and the very local impact that may occur, no data was sought from the local records centre at this time.

The property is situated to the southeast of Wokingham town centre and is surrounded by properties and gardens of differing sizes and styles, with housing developments in all directions. To the northwest lies a large playing field associated with a school and to the south large areas of farmland, both of which are likely to provide good habitat for bats and have ecological connectivity to the site via back gardens and tree and hedge lines. Recreational fields, meadows and areas of woodland lie in close proximity to the site, all of which provide good habitat for roosting, commuting and foraging bats and are connected to the site via the railway and hedgerows.

Urban Tree Experts

BS5837 – Tree Surveys – Ecological Consulting

No statutory designated sites are located within and no current EPSLs for bats have been granted within 2km of the site, however there are four expired ones.

4.2 Daylight Survey

The DBW of 7 Buckhurst Grove, Wokingham, RG40 2JR was carried out by Nick Powell on Tuesday 8 July 2025 at 10am. The weather conditions for the survey were dry and bright with a temperature of 21 degrees. Equipment used included a high-powered torch, a digital camera on a telescopic pole, endoscope and a ladder.

During the DBW an external inspection of the property was carried out to identify any signs of occupation by bats and features that could offer potential roosting sites following standard survey guidelines. Features investigated included:

- Construction of the building– soffits, loft space, tiles/slates, lead flashings etc.
- Building condition – structure of roof and walls.
- Internal conditions – microclimate stability, draughts etc.
- Access points – potential entry and exit points for bats.
- Roosting points – cracks and crevices, between underlay and roofing tiles/slates.

Field signs that would indicate the presence of bats were searched for. These included:

- Bat droppings on the floor and walls of the building.
- Feeding remains (particularly butterfly and moth wings).
- Evidence of urine and/or oily staining around possible roost entrances.
- Presence of areas cleared of cobwebs.
- Where a breathable roofing membrane has been fitted staining on the membrane may suggest use by bats.
- Odour can sometimes suggest the present of bats.
- Squeaking and chattering can reveal bats roosting between the tiles and roofing underlay.

Buildings or structures that were not to be affected by the current proposals or with no bat roosting potential were not inspected. This includes the detached garage as it will not be affected by the proposed works.

4.3 Constraints

Full access to the site during the visit was made possible by the client. A thorough inspection of the loft space could not be carried out due to the lack of boarding and thick insulation but given the good condition of the roof externally this was not considered a significant constraint to the survey.

5. Survey Findings

5.1 External Inspection

The external features of the property were examined for signs described in section 4.2. Windowsills, exposed features around the windows, fascias and walls were inspected for any evidence of bat droppings or staining.

Urban Tree Experts

BS5837 – Tree Surveys – Ecological Consulting

The property is brick-built and is in a good condition externally. The cross gabled roof is covered in close fitting tiles, none of which are missing or broken, and the valleys are sealed, see Figure 4 below. The ridge tiles are sealed with clips, there is no missing mortar from the verges or gaps in which bats could roost (see Figure 5 on page 9) and the uPVC soffits and fascias are all tightly fitted to the walls and have no cracks or splits in which roosting bats could exploit, see Figure 6 on page 9. The lead flashing around the chimney stack, Velux windows and flue pipe is also tightly fitted with no gaps in which crevice dwelling bats could utilise for roosting, see Figure 7 on page 10. There are dormer windows on both the front and rear elevations (see cover photo and rear view of property at Figure 8 on page 10), the pitched rooves of which are covered in close fitted tiles and there is no missing mortar from the ridge tiles and verges, see Figure 9 on page 11. The sides/front of the dormers are covered in hanging tiles, all of which are tightly fitted with no gaps that crevice dwelling bat species could exploit, see Figure 10 on page 11.

No bats or evidence of bats was recorded during the external inspection of the property and there were no visible roosting opportunities for bats or access into the building for roosting bats.

Figure 9. Example rooves of dormers. 7 Buckhurst Grove, Wokingham. 08.07.25

Figure 10. Example close fitting hanging tiles on dormers. 7 Buckhurst Grove, Wokingham. 08.07.25

5.2 Internal Inspection

An internal inspection of the property was undertaken and was examined for any signs of bats (as described in section 4.2).

The remaining loft space of the property was accessed via a ladder and was in a good condition internally. The loft was not lit, not boarded and deeply insulated (see Figure 11 below) and a thorough inspection was not possible, however given the good condition of the roof externally this was not considered a significant constraint to the survey. The roof tiles are lined with a membrane, see Figure 11 below.

No bats or evidence of bats was recorded during the internal inspection of the loft space and internally there appeared to be no roosting opportunities for bats within the loft.

Figure 11. Example remaining loft space. 7 Buckhurst Grove, Wokingham. 08.07.25

6. Evaluation

The bat roost potential of the features within the site have been assessed with reference to the following criteria and include seasonal variation where increased or decreased probability may arise. Where features are present, they are **highlighted in bold**.

The likelihood of bat roosts being present will be higher where structures:

- are of a pre-20th Century construction;
- are in a lowland rural setting;
- **have woodland, mature trees**, species-rich grassland **and/or water nearby**;
- have large dimension roof timbers with cracks, joints and holes;
- have numerous crevices in stonework and structures;
- have an uneven roof covering with gaps, though not too draughty;
- **have hanging tiles** or roof cladding, especially on south-facing walls;
- **have a roof warmed by the sun**;
- are disused or little used; largely undisturbed;
- provide appropriate hibernation conditions, such as abandoned mines, tunnels, kilns, or fortifications; or
- **Recent and historical records of bat roosts in the general area.**

The likelihood of bat roosts being present will be lower where structures:

- **are in an urban setting with little green space**;
- are subject to heavy disturbance (constant movement due to draughts and noise, also unstable microclimate);
- **have a small, cluttered roof void (particularly for brown long-eared)**;
- **are of a modern construction with few gaps or crevices that bats can fly or crawl through (though pipistrelle bats may still be present)**;
- are comprised of prefabricated steel or sheet materials; (some sections);
- are active industrial premises.

Please note that the above list provides generic screening criteria only and there are exceptions to consider.

7. Conclusions

7.1 Interpretation

The combined evidence from the desktop study and the internal and external inspection of the property provides a high level of confidence in support of the opinions set out in this report. There are no visible features externally on the building in which bats could access the building to roost.

Informed by the results of the survey and the factors highlighted in Section 6, it is concluded that there is negligible potential for roosting bats within the property. Based on recommendations in the Bat Workers Manual and the Bat Surveys Good Practice Guidelines, no further survey effort is required.

7.2 Contingency Plan

In the unlikely event that bats are found during the proposed works, all work must stop, and advice sought from Urban Tree Experts or another licensed bat ecologist.

Urban Tree Experts

BS5837 – Tree Surveys – Ecological Consulting

If, for whatever reason, there is a time delay of greater than 12 months between this survey and the commencement of work, then the survey should be repeated as the condition of the buildings may change and bats may start roosting at the site.

APPENDIX 1

In summary, the legislation combined makes it an offence to:

- Intentionally or recklessly damage, destroy or obstruct access to a structure or place used for shelter by a bat.
- Intentionally or recklessly disturb bats; in particular any disturbance which is likely to impair the ability of bats to survive, breed or reproduce or nurture their young; or in the case of hibernating or migrating bats, to hibernate or migrate.
- Intentionally or deliberately kill, injure or take any bat.

Planning Considerations:

Government guidance to Local Planning Authorities stipulates the need to consider biodiversity and protected species during the consideration of planning applications. The NPPF makes clear that the planning system should help minimise the impacts that development can have on biodiversity and provide net gains in biodiversity where possible. In addition, the ODPM Circular 04/2005 states *“It is essential that the presence or otherwise of protected species, and the extent that they may be affected by the proposed development, is established before the planning permission is granted, otherwise all relevant material considerations may not have been addressed in making the decision”*.

Policy CP7 of the Wokingham Borough Core Strategy (planning policy relating to the site) states *“Development which may harm habitats or, species of principle importance in England for nature conservation, veteran trees or features of the landscape that are of major importance for wild flora and fauna (including wildlife and river corridors), whether directly or indirectly will be only permitted if it has been clearly demonstrated that the need for the proposal outweighs the need to safeguard the nature conservation importance, that no alternative site that would result in less or no harm is available which will meet the need, and*

- i) Mitigation measures can be put in place to prevent damaging impacts; or*
- ii) Appropriate compensation measures to offset the scale and kind of losses are provided”*.

Developments that compromise the protection afforded to bats or roosts under the provisions of the Conservation of Habitats and Species Regulations 2017 and the Wildlife and Countryside Act 1981 will require a European Protected Species (EPS) licence from Natural England (NE).

NE, the government’s statutory conservation advisory organisation, is responsible for issuing EPS licences that would permit activities that would otherwise lead to an infringement of the Habitat Regulations.

Three tests must be satisfied before this licence (to permit otherwise prohibited acts) can be issued:

- Reg 44(2)(e) – the derogation is “in the interests of public health and public safety, or for other imperative reasons of overriding public interest, including those of a social or economic nature and beneficial consequences of primary importance for the environment”.
- Reg 44(3)(a) – there is “no satisfactory alternative” to the derogation.
- Reg 44(3)(b) –the derogation is “not detrimental to the maintenance of the populations of the species concerned at a favourable conservation status in their natural range”.

Tests (a) and (e) can be met with the issue of planning permission for the proposed works. Test (b) is determined by NE’s ecology department that requires the development of a suitable mitigation strategy that would ensure that any bats present on site, are retained at the same population level or better.
